

LINKING A USER SELECTED SEQUENCE OF RECEIVED WORLD  
WIDE WEB DOCUMENTS INTO A STORED DOCUMENT STRING  
AVAILABLE TO THE USER AT A RECEIVING WEB STATION

Abstract

5       Enabling the user to link a selected sequence of  
hypertext World Wide Web (Web) documents into a string  
and to store the string at his receiving Web display  
station so that these documents will be available for his  
use. An implementation at a receiving display station is  
10       provided for designating a received Web document as a  
starter document and for selecting a subsequently  
received Web document as a first next document. An  
implementation is provided for creating a hyperlink in  
the starter document to the first next document, together  
15       with means for storing said starter and next documents at  
said receiving display station.

      The invention further provides for an extension of  
the selected documents into a string through selecting  
one or more subsequently received Web documents as a  
20       subsequent next document and creating a hyperlink in the  
first next document to the subsequent next document. The  
subsequent next documents are also stored at the  
receiving display station to thereby store a selected  
string of linked Web documents. Preferably, each  
25       hyperlink to a next document is visually distinct from  
other hyperlinks in its document, e.g. the hyperlink may  
be highlighted.
